Configurations

A map $x : \mathbb{Z}^d \rightarrow \Sigma$ is called a **configuration**.

$$x : \mathbb{Z}^2 \rightarrow \{0, 1, 2\}$$

0	0	0	0	0	0	0	0	0	0	0	0

0	0	0	0	0	0	0	0	0	0	0	0

(both restricted to $[-5, 5] \times [-4, 3]$)

The **shift action** $\mathbb{Z}^d \stackrel{\sigma}{\curvearrowright} \Sigma^{\mathbb{Z}^d}$ is given by the map $\sigma : \mathbb{Z}^d \times \Sigma^{\mathbb{Z}^d} \rightarrow \Sigma^{\mathbb{Z}^d}$ where

$$\sigma^u(x)_v := \sigma(u, x)_v = x_{u+v} \quad \text{for every } u, v \in \mathbb{Z}^d, x \in \Sigma^{\mathbb{Z}^d}.$$

Asymptotic pair

Two configurations $x, y \in \Sigma^{\mathbb{Z}^d}$ are **asymptotic** if they differ in finitely many sites of \mathbb{Z}^d .

(both restricted to $[-5, 5] \times [-4, 3]$)

The set $F = \{n \in \mathbb{Z}^d : x_n \neq y_n\}$ is called the **difference set** of (x, y) .

Pattern, Cylinder, Language, Occurrences

- For finite subset $S \subset \mathbb{Z}^d$, a function $p: S \rightarrow \Sigma$ is called a **pattern** and the set S is its **support**. We denote it $p \in \Sigma^S$.
- Given a pattern $p \in \Sigma^S$, the **cylinder** centered at p is

$$[p] = \{x \in \Sigma^{\mathbb{Z}^d} : x|_S = p\}.$$

- For finite subset $S \subset \mathbb{Z}^d$, the **language with support S** of a configuration x is the set of patterns

$$\mathcal{L}_S(x) = \{p \in \Sigma^S : \text{there is } \mathbf{n} \in \mathbb{Z}^d \text{ such that } \sigma^\mathbf{n}(x) \in [p]\}.$$

The **language of x** is the union $\mathcal{L}(x)$ of the sets $\mathcal{L}_S(x)$ for every finite $S \subset \mathbb{Z}^d$.

- The **occurrences** of a pattern $p \in \Sigma^S$ in a configuration $x \in \Sigma^{\mathbb{Z}^d}$ is

$$\text{occ}_p(x) := \{\mathbf{n} \in \mathbb{Z}^d : \sigma^\mathbf{n}(x) \in [p]\}.$$

Language

$$x : \mathbb{Z}^2 \rightarrow \{0, 1, 2\}$$

1	0	2	2	1	0	2	1	0	2	1
0	2	1	1	0	2	1	0	2	1	0
2	1	0	2	2	1	0	2	1	0	2
1	0	2	1	1	0	2	1	0	2	1
0	2	1	0	2	2	1	0	2	1	0
2	1	0	2	1	0	2	2	1	0	2
1	0	2	1	0	2	1	1	0	2	1
0	2	1	0	2	1	0	2	2	1	0

The **language** of patterns of support $S = \{\mathbf{0}, \mathbf{e}_1, 2\mathbf{e}_1, \mathbf{e}_2\}$ in x is

$$\mathcal{L}_S(x) = \left\{ \begin{array}{c} \boxed{0} \\ \boxed{2} \boxed{1} \boxed{0} , \quad \boxed{0} \\ \boxed{2} \boxed{1} \boxed{1} , \quad \boxed{1} \\ \boxed{0} \boxed{2} \boxed{1} , \quad \boxed{1} \\ \boxed{2} \boxed{2} \boxed{1} , \\ \hline \boxed{1} \\ \boxed{0} \boxed{2} \boxed{2} , \quad \boxed{2} \\ \boxed{0} \boxed{2} \boxed{2} , \quad \boxed{2} \\ \boxed{1} \boxed{0} \boxed{2} , \quad \boxed{1} \\ \boxed{1} \boxed{1} \boxed{0} \end{array} \right\}$$

Also $\mathcal{L}_S(x, y) := \mathcal{L}_S(x) \cup \mathcal{L}_S(y)$ for every finite support $S \subset \mathbb{Z}^d$.

in x and y are

$$\text{occ}_p(x) = \{(-5, 2), (1, 1), (3, -3), \dots\},$$

$$\text{occ}_p(y) = \{(-5, 2), (1, 1), (3, -3), \dots\},$$

$$\text{occ}_p(x) \setminus \text{occ}_p(y) = \{(0, 0)\},$$

$$\text{occ}_p(y) \setminus \text{occ}_p(x) = \{(-2, -1)\}.$$

Indistinguishable asymptotic pair

Let $p \in \Sigma^S$ is a pattern of finite support $S \subset \mathbb{Z}^d$.

If $x, y \in \Sigma^{\mathbb{Z}^d}$ are asymptotic configurations with difference set F , then

$$\text{occ}_p(x) \setminus \text{occ}_p(y) = \text{occ}_p(x) \cap (F - S)$$

and in particular it **is finite**.

Definition

We say that (x, y) is an **indistinguishable asymptotic pair** if (x, y) is asymptotic and the following equality holds

$$\#(\text{occ}_p(x) \setminus \text{occ}_p(y)) = \#(\text{occ}_p(y) \setminus \text{occ}_p(x))$$

for every pattern p of finite support.

Not all asymptotic pair is indistinguishable

$$x : \mathbb{Z}^2 \rightarrow \{0, 1, 2\}$$

$$\text{occ}_p(y) = \emptyset,$$

$$\text{occ}_p(x) \setminus \text{occ}_p(y) = \{(-1, -1)\},$$

$$\text{occ}_p(y) \setminus \text{occ}_p(x) = \emptyset.$$

Initial question

In Fall 2019, Sebastian Barbieri asked :

Question

Is there any non trivial pair $x, y \in \Sigma^{\mathbb{Z}^d}$ of indistinguishable asymptotic configurations ?

A trivial pair refers to cases like (x, x) and $(x, \sigma^n(x))$ where $n \in \mathbb{Z}^d$.

 S. Barbieri, R. Gómez, B. Marcus, T. Meyerovitch, and S. Taati. Gibbsian representations of continuous specifications : the theorems of Kozlov and Sullivan revisited. Communications in Mathematical Physics, 382(2) :1111–1164, 2021.

Sturmian words (Morse, Hedlund, 1940)

Let $\alpha \in [0, 1] \setminus \mathbb{Q}$ and $c_\alpha, c'_\alpha : \mathbb{Z} \rightarrow \{0, 1\}$ be the configurations

$$c_\alpha(n) = \lfloor \alpha(n+1) \rfloor - \lfloor \alpha n \rfloor \quad (\text{lower characteristic Sturmian word})$$

$$c'_\alpha(n) = \lceil \alpha(n+1) \rceil - \lceil \alpha n \rceil \quad (\text{upper characteristic Sturmian word})$$

... are indistinguishable

$$c_\alpha = \dots 101001010010 \boxed{1.0} 010010100101 \dots$$

$$c'_\alpha = \dots 101001010010 \boxed{0.1} 010010100101 \dots$$

... are indistinguishable and vice versa

$$c_\alpha = \cdots 101001010010 \boxed{1.0} 010010100101 \cdots$$

$$c'_\alpha = \cdots 101001010010 \boxed{0.1} 010010100101 \cdots$$

Theorem (Barbieri, L, Starosta, 2021)

Let $x, y \in \{0, 1\}^{\mathbb{Z}}$ and assume that x is **recurrent**.

The pair (x, y) is an **indistinguishable asymptotic pair** with difference set $F = \{-1, 0\}$ such that $x_{-1}x_0 = 10$ and $y_{-1}y_0 = 01$

if and only if

there exists $\alpha \in [0, 1] \setminus \mathbb{Q}$ such that $x = c_\alpha$ and $y = c'_\alpha$ are the lower and upper **characteristic Sturmian words** of slope α .

Discrete planes

A **discrete plane** of **normal vector** $v \in \mathbb{R}^3$, **intercept** μ and **width** ω is the subset

$$\{p \in \mathbb{Z}^3 \mid 0 \leq p \cdot v + \mu < \omega\} \subset \mathbb{Z}^3.$$

For example, with $\mu = 0$ and $\omega = \|v\|_1/2$, we get :

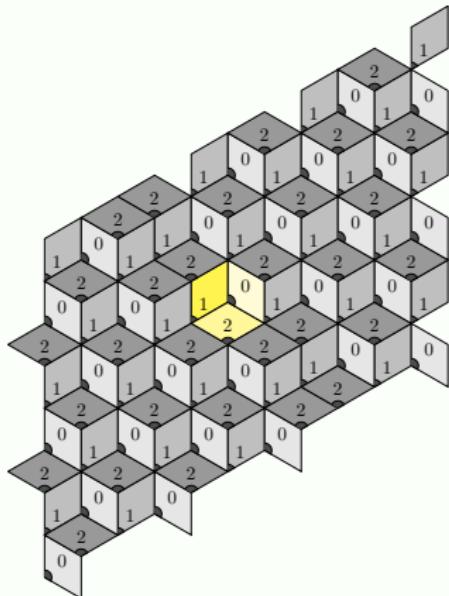

- P. Arnoux, V. Berthé, and S. Ito. *Discrete planes, \mathbb{Z}^2 -actions, Jacobi-Perron algorithm and substitutions*. Annales de l'Institut Fourier, 52(2) :305–349, 2002.
- D. Jamet and J.-L. Toutant, *On the connectedness of rational arithmetic discrete hyperplanes*, LNCS 4245, 223–234, 2006.

Encoding upper and lower discrete planes

When $\mu = 0$ and $\omega = \|\mathbf{v}\|_1$, we get the vertices of the surface of a **standard** discrete plane of normal vector $\mathbf{v} \in \mathbb{R}^3$:

$$\{p \in \mathbb{Z}^3 \mid 0 \leq p \cdot \mathbf{v} < \|\mathbf{v}\|_1\} \subset \mathbb{Z}^3 \quad \text{Encoding : } \mathbb{Z}^2 \rightarrow \{0, 1, 2\}$$

d -dimensional Sturmian configurations

Let $\alpha \in [0, 1)^d$ be a **totally irrational vector**, that is,

$$\mathbf{n} \in \mathbb{Z}^d, \mathbf{n} \cdot \alpha \in \mathbb{Z} \implies \mathbf{n} = \mathbf{0}.$$

Definition

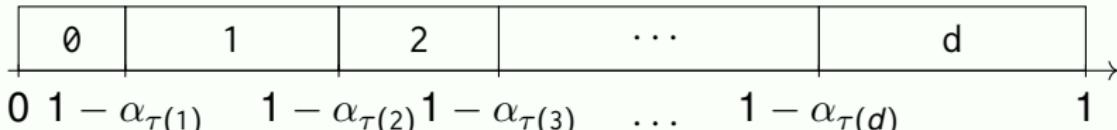

The **lower** and **upper characteristic d -dimensional Sturmian configurations** with slope α are respectively :

$$c_\alpha : \mathbb{Z}^d \rightarrow \{0, 1, \dots, d\}$$

$$\mathbf{n} \mapsto \sum_{i=1}^d (\lfloor \alpha_i + \mathbf{n} \cdot \alpha \rfloor - \lfloor \mathbf{n} \cdot \alpha \rfloor)$$

$$c'_\alpha : \mathbb{Z}^d \rightarrow \{0, 1, \dots, d\}$$

$$\mathbf{n} \mapsto \sum_{i=1}^d (\lceil \alpha_i + \mathbf{n} \cdot \alpha \rceil - \lceil \mathbf{n} \cdot \alpha \rceil).$$

Example

With $\alpha = (\alpha_1, \alpha_2) = (\sqrt{2}/2, \sqrt{19} - 4)$:

$$c_\alpha : \mathbb{Z}^2 \rightarrow \{0, 1, 2\}$$

$$c'_\alpha : \mathbb{Z}^2 \rightarrow \{0, 1, 2\}$$

is an indistinguishable asymptotic pair encoding the projection of the surface of a discrete plane of normal vector

$$(1 - \alpha_1, \alpha_1 - \alpha_2, \alpha_2) \approx (0.293, 0.348, 0.359).$$

Proposition (Barbieri, L., 2022)

Let $d \geq 1$. Let $\alpha \in [0, 1]^d$ be a totally irrational vector. The lower and upper **characteristic d -dimensional Sturmian configurations** (c_α, c'_α) with slope α is an **indistinguishable asymptotic pair**.

The 8 patterns of support $\{0, \mathbf{e}_1, 2\mathbf{e}_1, \mathbf{e}_2\}$ appearing in c_α and c'_α :

Proposition (Barbieri, L., 2022)

Let $d \geq 1$. Let $\alpha \in [0, 1]^d$ be a totally irrational vector. The lower and upper **characteristic d -dimensional Sturmian configurations** (c_α, c'_α) with slope α is an **indistinguishable asymptotic pair**.

Question

What about the reciprocal ?

Flip condition

Definition

An asymptotic pair $x, y \in \{0, 1, \dots, d\}^{\mathbb{Z}^d}$ satisfies the **flip condition** if

- ① the difference set of x and y is $F = \{\mathbf{0}, -\mathbf{e}_1, \dots, -\mathbf{e}_d\}$,
- ② the restriction $x|_F$ is a **bijection** $F \rightarrow \{0, 1, \dots, d\}$,
- ③ the map defined by $x_n \mapsto y_n$ for every $n \in F$
is a **cyclic permutation** on the alphabet $\{0, 1, \dots, d\}$.

Without lost of generality, we assume that $x_0 = 0$ and

$y_n = x_n - 1 \bmod (d + 1)$ for every $n \in F$.

$$x : \mathbb{Z}^2 \rightarrow \{0, 1, 2\}$$

Flip condition

The flip condition may be interpreted as the **geometrical flip** of the faces of a hypercube at the origin of a **discrete hyperplane** :

T. Jolivet. Combinatorics of Pisot Substitutions. *PhD Thesis, 2013.*

Damien Jamet, *Coding Stepped Planes and Surfaces by Two-Dimensional Sequences over a Three-Letter Alphabet* 05047, 2005, pp.21

Theorem B

Theorem B (Barbieri, L., 2022)

Let $d \geq 1$ and $x, y \in \{0, 1, \dots, d\}^{\mathbb{Z}^d}$ s.t. x is **uniformly recurrent**. The pair (x, y) is an **indistinguishable asymptotic pair** satisfying the flip condition

if and only if

there exists a **totally irrational vector** $\alpha \in [0, 1)^d$ such that $x = c_\alpha$ and $y = c'_\alpha$ are the lower and upper **characteristic d -dimensional Sturmian configurations** with slope α .

(Theorem B depends on Theorem A)

Theorem A

Theorem A (Barbieri, L., 2022)

Let $d \geq 1$ and $x, y \in \{0, 1, \dots, d\}^{\mathbb{Z}^d}$ be an asymptotic pair satisfying the **flip condition** with difference set $F = \{\mathbf{0}, -\mathbf{e}_1, \dots, -\mathbf{e}_d\}$. The following are equivalent :

- (i) For every nonempty finite **connected** subset $S \subset \mathbb{Z}^d$ and $p \in \mathcal{L}_S(x) \cup \mathcal{L}_S(y)$, we have

$$\#(\text{occ}_p(x) \setminus \text{occ}_p(y)) = 1 = \#(\text{occ}_p(y) \setminus \text{occ}_p(x)).$$

- (ii) The asymptotic pair (x, y) is **indistinguishable**.
- (iii) For every nonempty finite **connected** subset $S \subset \mathbb{Z}^d$, the **pattern complexity** of x and y is

$$\#\mathcal{L}_S(x) = \#\mathcal{L}_S(y) = \#(F - S).$$

Complexity $\#(F - S)$

Complexity $\#(F - S)$ matches what is known :

- When $d = 1$ and $S = \{0, 1, \dots, n - 1\}$:

$$\#(F - S) = \#(\{0, -1\} - \{0, 1, \dots, n - 1\}) = n + 1$$

is the factor complexity of **Sturmian words**.

Complexity $\#(F - S)$

Complexity $\#(F - S)$ matches what is known :

- When $d = 1$ and $S = \{0, 1, \dots, n - 1\}$:

$$\#(F - S) = \#(\{0, -1\} - \{0, 1, \dots, n - 1\}) = n + 1$$

is the factor complexity of **Sturmian words**.

- When $d = 2$ and $S = \{0, 1, \dots, n - 1\} \times \{0, 1, \dots, m - 1\}$:

$$\begin{aligned}\#(F - S) &= \#(\{\mathbf{0}, -\mathbf{e}_1, -\mathbf{e}_2\} - \{(i, j) : 0 \leq i < n, 0 \leq j < m\}) \\ &= mn + m + n\end{aligned}$$

is the rectangular pattern complexity of a **discrete plane** with totally irrational slope.

Outline

- 1 A question on asymptotic pairs of configurations
- 2 When $d = 1$: a complete answer
- 3 When $d \geq 1$: a partial answer
- 4 Open questions

Open question 1

Theorem (Barbieri, L, Starosta, 2021)

Let $x, y \in \{0, 1\}^{\mathbb{Z}}$.

The pair (x, y) is an **indistinguishable asymptotic pair** with difference set $F = \{-1, 0\}$ such that $x_{-1}x_0 = 10$ and $y_{-1}y_0 = 01$

if and only if

there exists a monotone sequence $(\alpha_n)_{n \in \mathbb{N}}$ with $\alpha_n \in [0, 1] \setminus \mathbb{Q}$ s.t.
 $x = \lim_{n \rightarrow \infty} c_{\alpha_n}$ and $y = \lim_{n \rightarrow \infty} c'_{\alpha_n}$ are the limits of **characteristic Sturmian words** of slope α_n .

Moreover, indistinguishable asymptotic pairs over \mathbb{Z} for any finite difference set F are described in terms of derived sequences.

Open question

Describe indistinguishable asymptotic pair $x, y \in \Sigma^{\mathbb{Z}^d}$ satisfying the flip condition where x is **not uniformly recurrent**.

Open question 2

A sequence $w \in \Sigma^{\mathbb{Z}}$ with $\#\mathcal{L}_n(w) \leq n$ is eventually periodic.

Nivat's conjecture

A configuration $x \in \Sigma^{\mathbb{Z}^2}$ for which there are $n, m \in \mathbb{N}$ with $\#\mathcal{L}_{(n,m)}(x) \leq nm$ is periodic.

Equivalently, a sequence $w \in \Sigma^{\mathbb{Z}}$ with totally irrational vector of symbol frequencies has complexity $\#\mathcal{L}_n(w) \geq n + 1$.

Dual Nivat Conjecture

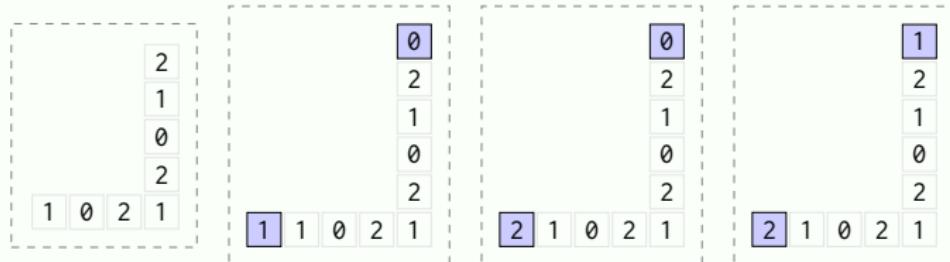

Let $d \geq 1$ and $F = \{\mathbf{0}, -\mathbf{e}_1, \dots, -\mathbf{e}_d\}$. Let $x \in \{0, 1, \dots, d\}^{\mathbb{Z}^d}$ be a configuration with trivial stabilizer, i.e., $\sigma^n(x) = x$ only holds for $n = 0$. If the **frequencies** of symbols in x **exist and are rationally independent**, then $\#\mathcal{L}_S(x) \geq \#(F - S)$ for every nonempty connected finite support $S \subset \mathbb{Z}^d$.

J. Cassaigne. Double sequences with complexity $mn + 1$. volume 4, pages 153–170. 1999. Journées Montoises d’Informatique Théorique (Mons, 1998).

Open question 3

The pattern below is bispecial within the language of c_α and c'_α :

Bispecial factors within the language of a Sturmian sequence of slope $\alpha \in [0, 1)$ are related to the convergents of the continued fraction expansion of α (de Luca, 1997).

Question

Let $d \geq 1$ and $\alpha \in [0, 1)^d$ be a totally irrational vector. What is the relation between the set

$$V_\alpha = \left\{ b - a : \exists w \in \mathcal{L}(c_\alpha) \text{ bispecial at positions } a, b \in \mathbb{Z}^d \right\}$$

and **simultaneous Diophantine approximations** of α ?
